Peter-GYM App Explained

This document explains the app based on the current code structure and routes.

1) How many dashboards are there?

This app has 3 main dashboards after authentication: Admin, Trainer, and Member.

2) What happens when a user opens the app?

The app checks for an existing session. If not logged in, it goes to the intro screen, then login/register, then the role-based dashboard.

3) Default registration role

The default role in the register form is Member. If the user does not change it, they are created as a member.

4) Role mapping

Member -> /member/dashboard | Trainer -> /trainer/dashboard | Gym Admin / Super Admin -> /admin/dashboard

5) Admin dashboard features

Members, membership, calendar, attendance, reports, payments, notifications, settings.

6) Trainer dashboard features

Assigned members, training overview, sessions, scheduling, workouts, progress.

7) Member dashboard features

Plan, attendance, workout streak, payment status, notifications, profile.

8) What works and what is incomplete

The app is a strong demo UI with working dashboards, role routes, and mock data; however real backend integration is still incomplete.

9) Firebase and Firestore role

Auth handles login/register/logout. Firestore is designed to store user profiles in users/{uid}. If Firebase config is missing, the app falls back to local demo mode.

Flowchart

Open website | v Check if user is already logged in? |-- Yes --> Redirect to role dashboard |-- No --> Intro screen | v Skip Intro or Login | +-------+--------+ | | v v Login Page Register Page | | v v Validate session Choose role | | +--------+-------+ v Role-based dashboard | +--------+--------+ | | v v Member Trainer / Admin /member/dashboard /trainer/dashboard or /admin/dashboard

Important note

This project is already a strong gym management frontend prototype, but the real live backend still needs Firebase Firestore integration, proper member CRUD, attendance tracking, and payment processing.

Quick role map

- Member: /member/dashboard -> Personal fitness dashboard
- Trainer: /trainer/dashboard -> Training and member tracking
- Gym Admin: /admin/dashboard -> Full gym operations
- Super Admin: /admin/dashboard -> Full gym operations

Conclusion

A new user defaults to Member, but can choose Trainer or Gym Admin during registration. The app then redirects the user to the correct dashboard based on the saved role.
